**Please find below and/or attached an Office communication concerning this application or proceeding.**

The time period for reply, if any, is set in the attached communication.

### Office Action Summary

**Application No.**

10/722,038

**Applicant(s)**

PECK, JEFF

**Examiner**

PARAS SHAH

**Art Unit**

2626

**Period for Reply** -- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

**Status**

- 1) ☒ Responsive to communication(s) filed on 14 May 2008.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

**Disposition of Claims**

- 4) ☒ Claim(s) 1-3,5,7-16,19 and 20 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 1-3,5,7-16,19 and 20 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

**Application Papers**

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

**Priority under 35 U.S.C. § 119**

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some \* c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
  2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

**Attachment(s)**

- 1) ☒ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☐ Information Disclosure Statement(s) (PTO/S508)  
Paper No(s)/Mail Date \_\_\_\_\_
- 4) ☐ Interview Summary (PTO-413)  
Paper No(s)/Mail Date \_\_\_\_\_
- 5) ☐ Notice of Informal Patent Application
- 6) ☐ Other: \_\_\_\_\_

### **DETAILED ACTION**

1. This Office Action is in response to the RCE filed on 05/14/2008. Claims 1-3, 5, 7-16, 19, and 20 remain pending and have been examined. The Applicants' remarks have been carefully considered, but they are not persuasive and do not place the claims in condition for allowance.
2. All previous objections and rejections directed to the Applicant's disclosure and claims not discussed in this Office Action have been withdrawn by the Examiner. Further, it should be noted that since applicant did not traverse the examiner's assertion of official notice, the common knowledge or well-known in the art statement is taken to be admitted prior art because applicant either failed to traverse the examiner's assertion of official notice or that the traverse was inadequate (see MPEP 2144.03, C).

### ***Response to Arguments***

3. Applicant's arguments, see page 6, filed on 05/14/2008 with respect to the rejection(s) of claim(s) 1, 9, and 14 under Tackin (US 7,180,892) in view of Smith *et al.* (US 6,862,298) have been fully considered and are moot in view of new grounds for rejection. Accordingly, new references have been cited, Gentle in view of Dowdal.

### ***Claim Rejections - 35 USC § 101***

4. 35 U.S.C. 101 reads as follows:

Whoever invents or discovers any new and useful process, machine, manufacture, or composition of matter, or any new and useful improvement thereof, may obtain a patent therefor, subject to the conditions and requirements of this title.

Claims 14-20 are rejected under 35 U.S.C 101 because the claimed invention is directed to non-statutory subject matter.

The statutory class of the claimed limitations in claim 14-20 do not fall under the statutory class of manufacture. The statutory class of "manufacture" deals with production of raw materials for use from raw materials. Hence, the claim as it stands falls under an incorrect statutory class.

Claims 14-20 are drawn to a "article" and a "storage medium" *per se* as recited in the preamble and as such is non-statutory subject matter. Further, from the Applicant's Specification, it was described that the medium can be a communications medium or a computer readable storage medium as described in Applicants Specification, pages 4-5, last paragraph on page 4, continued into page 5, and page 10, lines 8-11. From the cited portions, it is unclear whether the article is related to the communications media or computer readable media. See MPEP 2106.01 [R-5]. Data structures not claimed as embodied in computer readable media are descriptive material *per se* and are not statutory because they are not capable of causing functional change in the computer. See e.g., *Warmerdam*, 33 F.3d at 1361, 31, USPQ2d at 1760 (claim to a data structure *per se* held nonstatutory). Such claimed data structures do not define any structural and functional interrelationships between data and other claimed aspects of the invention, which permit the data structure's functionality to be realized. In contrast, a claimed computer readable medium encoded with a data structure defines structural and functional interrelationships between the data structure and the computer software and hardware components which permit the data structure's functionality to be realized, and

is thus statutory. It is advised that the Applicant change the preamble of the claim to recite a "computer readable storage medium including stored instructions that, when executed by a processor...."

***Claim Rejections - 35 USC § 112***

5. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

6. Claims 14-20 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention. From the Applicant's Specification, it was described that the medium can be a communications medium or a computer readable storage medium as described in Applicants Specification, pages 4-5, last paragraph on page 4, continued into page 5, and page 10, lines 8-11. From the cited portions, it is unclear whether the article is related to the communications media or computer readable media. For the purposes of compact prosecution the limitation was interpreted to mean a communications media.

***Claim Rejections - 35 USC § 103***

5. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

6. Claims 1, 5, 7, 9, 13, 14, and 19 are rejected under 35 U.S.C. 103(a) as being unpatentable over Gentle et al. (US 2004/0073692) in view of Dowdal (US 7,346,005).

As to claims 1 and 14, Gentle teaches a method, comprising:

receiving a plurality of packets (see [0036], VAD monitors packet structures in incoming digital voice stream) with audio information (see Abstract, audio stream, also see [0036], voice) (e.g. Applicant defines audio information to include voice and silence (see page 4, [0006], lines 3-5). Audio packets are retrieved.);

determining by a voice activity detector (see [0036], VAD 220) whether said audio information represents voice information (see [0036], VAD determines if voice activity is present) (e.g. The determination of the audio information is found by the voice activity detector 220.); and

buffering said audio information in a jitter buffer (see Figure 3, buffer manager 330) after said determination (see [Figure 2, VAD 220]. The reference also teaches the use of a computer entailing a computer readable medium for the above limitations (see [0030])) (e.g. Audio information is buffered.).

wherein said determining comprises:

receiving frames of audio information at a voice activity detector (see [0036], packet structures are received);

measuring at least one characteristic (see [0051], [0036], and [0004], where the Reference discloses convention technique and shows an alternative

based on silence threshold to determine voice activity and energy level measurements) of said frames (see [0036], packet structure )

determining a start of voice information based on said measurements (see [0052], VAD 220 determines silence or nonsilence as well as beginning and endpoints); and

determining an end to said voice information based on said (see [0052], VAD 220 determines silence or nonsilence as well as beginning and endpoints) and a delay interval (see [0051], timing measurement module used to determine jitter by VAD 220); and

adjusting of the delay interval (see [0043], timing measurement module allows adaptive control of FIFO delay)

However, Gentle does not specifically teach the adjusting of the delay interval based on an average packet delay time.

Dowdal teaches the adjusting said delay interval to correspond to an average packet delay time (see col. 4, lines 33-60, delay between packets are calculated and a calculated running average is maintained in order to reset the value of the FIFO buffer for playout).

It would have been obvious to one of ordinary skilled in the art at the time the invention was made to have modified the voice based packet network as taught by Gentle with the use of a delay based on the average packet delay time as taught by Dowdal. The motivation to have combined the two references

involves the improvement in audio quality for effective playout of audio by minimizing jitter and delay (see Dowdal, col. 1, lines 15-21).

As to claim 5, Gentle in view of Dowdal teaches all of the limitations as in claim 1, above.

Furthermore, Gentle teaches said characteristic comprises an estimate of an energy level for said frame (see [0051], energy level measurement can be employed by VAD 220) (e.g. An energy level is used to determine if speech is present.).

As to claims 7 and 19, Gentle in view of Dowdal teaches all of the limitations as in claims 1 and 14, above.

Furthermore, Dowdal teaches measuring an average packet delay time by said jitter buffer (see Dowdal, (see col. 4, lines 33-60, delay between packets are calculated and a calculated running average is maintained in order to reset the value of the FIFO buffer for playout).

Furthermore, Gentle and Dowdal teaches sending said average packet delay time (see Dowdal, col. 4, lines 33-60) to said voice activity detector (see Figure 2, acoustic prioritization agent 232, and VAD 220 and [0041]) (e.g. The prioritization agent communicated with VAD the packet beginning and endpoints for synchronization)

As to claim 9, Gentle teaches a system comprising:

an antenna (see [0030], radio, telephone, wired analog, etc. )(e.g. It is inherent that digital phones consist of built-in antenna as well as a receiver for hearing audio information and transmitter for transmitting information. );

a receiver connected to said antenna (see [0030], radio, telephone, wired analog, etc. and see Figure 3, 228, receives information from first user and [0040]) to receive a frame of information (e.g. The receiver receives the packets of information from first user)

a voice activity detector (see [0036], VAD determines if voice activity is present) to detect voice information in said frame see [0036], VAD monitors packet structures in incoming digital voice stream) (e.g. The determination of the audio information is found by the voice activity detector 220.); and

a jitter buffer (see Figure 3, buffer manager 330) to buffer said information after said detection by said voice activity detector buffer (see Figure 2, VAD 220)).

wherein said voice activity detector receives frames of audio information, measures at least one characteristic of said frames (see [0051], [0036], and [0004], where the Reference discloses convention technique and shows an alternative based on silence threshold to determine voice activity and energy level measurements and (see [0036], packet structure ), determines a start of voice information based on said measurements (see [0052], VAD 220 determines silence or nonsilence as well as beginning and endpoints),

determines an end to said voice information based on said (see [0052], VAD 220 determines silence or nonsilence as well as beginning and endpoints) and a delay interval (see [0051], timing measurement module used to determine jitter by VAD 220), adjusting of the delay interval (see [0043], timing measurement module allows adaptive control of FIFO delay)

However, Gentle does not specifically teach the adjusting of the delay interval based on an average packet delay time.

Dowdal *et al.* teaches the adjusting said delay interval to correspond to an average packet delay time (see col. 4, lines 33-60, delay between packets are calculated and a calculated running average is maintained in order to reset the value of the FIFO buffer for playout).

It would have been obvious to one of ordinary skilled in the art at the time the invention was made to have modified the voice based packet network as taught by Gentle with the use of a delay based on the average packet delay time as taught by Dowdal. The motivation to have combined the two references involves the improvement in audio quality for effective playout of audio by minimizing jitter and delay (see Dowdal, col. 1, lines 15-21).

As to claim 13, Gentle in view of Dowdal teaches all of the limitations as in claim 9, above.

Furthermore, Gentle teaches said voice activity detector further comprises

an estimator to estimate energy level values (see [[0051], energy level measurement by VAD 220) (e.g. Energy levels are estimated.);

a voice classification module connected to said estimator to classify information for said frame (see [0051], VAD 220 classifies based on silence or non-silence)

7. Claims 2, 3, 12, 15, and 16 are rejected under 35 U.S.C. 103(a) as being unpatentable over Gentle in view of Dowdal, as applied to claims 1, 9, and 14 above, in view of Clemm (US 6,865,162).

As to claims 2 and 15, Gentle in view of Dowdal teach a voice based packet network.

However, Gentle in view of Dowdal. does not specifically teach the buffering of a portion of said audio information in a pre-buffer for a predetermined time interval.

Clemm does teach the use of a buffer (see col. 2, line 31) for a predetermined time (see col. 2, lines 31-33) prior to said determining (see Figure 1, elements 110 and 120 and col. 2, lines 30-37) (e.g. A pre-buffer is used.).

It would have been obvious to one of ordinary skilled in the art at the time the invention was made to have modified the voice based packet network as taught by Gentle in view of Dowdal with the buffer before the voice activity detector as taught by Clemm. The motivation to have combined the two

references involve the elimination of clipping associated with voice activity detector directed during silence suppression (see Clemm col. 2, lines 47-48).

As to claims 3 and 16, Gentle in view of Dowdal teaches all of the limitations as in claims 1 and 13, above.

Furthermore, gentle teaches sending said information from the jitter buffer to an end user (see Figure 3, second user, 312) (e.g. The applicant denotes the endpoint to be defined as the human user (see Applicant's Specification, page 8, [0018], lines 5-6). (Further, the sending of audio information to the user from the pre-buffer would have been apparent with the teaching presented by Clemm to avoid clipping).

As to claim 12, Gentle in view of Dowdal teach all of the limitations as in claim 9.

Furthermore, Gentle in view of Dowdal *et al.* teach a voice packet based network.

However, Gentle in view of Dowdal do not specifically teach the buffering of a portion of said audio information in a pre-buffer for a predetermined time interval.

Clemm teaches further comprising a buffer to store pre-threshold speech during detection by voice activity detector (see Figure 1, elements 110 and 120 and col. 2, lines 30-37) (The reference buffers a pre-threshold speech based upon two values, from a delay.)

It would have been obvious to one of ordinary skilled in the art at the time the invention was made to have modified the voice based packet network as taught by Gentle in view of Dowdal with the buffer before the voice activity detector as taught by Clemm. The motivation to have combined the two references involve the elimination of clipping associated with voice activity detector directed during silence suppression (see Clemm ,col. 2, lines 47-48).

8. Claims 8, 10, 11, and 20 are rejected under 35 U.S.C. 103(a) as being unpatentable over Gentle in view of Dowdal as applied to claim 9 above, and further in view of Sih *et al.* (US 5,920,834).

As to claims 8 and 20, Gentle in view of Dowdal teaches all of the limitations as in claim 1 and 14, above.

Furthermore, Gentle teaches retrieving a frame (see Figure 2, output of 212) of audio information from said packets (e.g. Audio information in the form of voice is received, which has undergone pulse code modulation);

canceling echo from said frame of audio information (see echo canceller 216); and

sending said frame of audio information to a voice activity detector (see Figure 6, output of echo canceller 216 to input of VAD 220).

However, Gentle in view of Dowdal do not specifically teach the receiving of an echo cancellation reference signal.

Sih does teach receiving an echo cancellation reference signal (col. 6, lines 14-18) and Figure 2, echo canceller 10,  $z'(n)$  is the reference signal.);

It would have been obvious to one of ordinary skilled in the art at the time the invention was made to have modified the voice based packet network as taught by Gentle in view of Dowdal with the use of a reference signal to cancel echo as taught by Sih for the purpose of noise suppression (see Sih, col. 3, lines 5).

As to claim 10, Gentle in view of Dowdal teach all of the limitations as in claim 9.

Furthermore, Gentle in view of Dowdal teach a voice packet based network.

However, Gentle in view of Dowdal do not specifically teach the echo canceller connected to a receiver to cancel the echo.

However, Sih *et al.* does teach the echo canceller being connected to a receiver (see Figure 1, elements 14 and 10) (e.g. It is evident that a transceiver consists of a receiver and a transmitter).

It would have been obvious to one of ordinary skilled in the art at the time the invention was made to have the echo canceller connected to a receiver. The motivation to have combined the two references involves cancellation of echo for mobile phones that may occur in speech signals (e.g. see Sih *et al.*, col. 23-25) as would have been apparent in the teachings of Gentle, which describes communication between telephony devices.

As to claim 11, Gentle in view of Dowdal in view of Sih *et al.* teaches all of the limitations as in claim 9.

Furthermore, Sih *et al.* teaches a transmitter (see Figure 1, element 14) (e.g. Transceiver consists of a transmitter) to provide an echo cancellation signal to said echo canceller (see Figure 1, element 10 and col. 6, lines 14-18).

### **Conclusion**

9. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Shaffer *et al.* (US 6,707,821) is cited to disclose jitter minimization in a packet based system. Bhattacharya *et al.* (US 7,376,148) and Eckberg (US 2003/0202528) is cited to disclose minimization of jitter in a packet network. LeBlanc (US 2004/0057445) is cited to disclose jitter buffer in a packet voice system. El-Hennawey (US 2004/0071084) is cited to disclose quality monitoring of voice based network.

10. Any inquiry concerning this communication or earlier communications from the examiner should be directed to PARAS SHAH whose telephone number is (571)270-1650. The examiner can normally be reached on MON.-THURS. 7:00a.m.-4:00p.m. EST.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Patrick Edouard can be reached on (571)272-7603. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
